T "Nucleotide sequence of the cell wall proteinase gene of
Streptococcus cremoris WG2.",

L Appl. Environ. Microbiol. 54:231-238(1988).

C -!- FUNCTION: PROTEASE WHICH BREAKS DOWN MILK PROTEINS DURING THE
C GROWTH OF THE BACTERIA ON MILK.

C --- CATALYTIC ACTIVITY: Endopeptidase activity with very broad
specificity, although some subsite preference have been noted,
c --- CATALYTIC ACTIVITY: Endopeptidase activity with very broad
specificity, although some subsite preference have been noted,
c --- CATALYTIC ACTIVITY: Endopeptidase activity with very broad
specificity, although some subsite preference have been noted,
c --- CATALYTIC ACTIVITY: Endopeptidaes in the PI and P4 positions, and
Pro in the P2 position. Best known for its action on caseins,
although it has been shown to hydrolyze hemoglobin and oxidized
insulin B-chain.

C --- SUBCELULAR LOCATION: Attached to the cell wall peptidoglycan by
c an amide bond (Poctential).

C --- SIMILARITY: Belongs to peptidase family S8.
                                                                                                                                                                                                                                                                                                                                                            Bacteria; Firmicutes; Lactobacillales; Streptococcaceae; Lactococcus

Ubiquitin carboxyl-terminal hydrolase 32 (EC 3.1.2.15) (Ubiquitin thiolesterase 32) (Ubiquitin-specific processing protease 32)
(Deubiquitinating enzyme 32) (NY-REN-60 antigen).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -!- CATALYTIC ACTIVITY: Ubiquitin C-terminal thiolester + H(2)O = ubiquitin + a thiol.
-!- SIMILARITY: Belongs to peptidase family C19.
-!- SIMILARITY: Contains 2 EF-hand calcium-binding domains.
                                                                                                                                                                                                                                                                                                                                                                          Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,
Mammalia, Eutheria, Primates, Catarrhini, Hominidae, Homo.

processing of the potyviral polyprotein.
PTM: VPG is covalently linked to the genomic RNA.
PTM: The viral RNA of potyviruses is expressed as a single polyprotein which undergoes posttranslational proteclytic processing resulting in the production of at least eight
                                                                                                                                                                 SIMILARITY: HC PROTEINASE BELONGS TO PEPTIDASE FAMILY CG. SIMILARITY: NI-A PROTEINASE BELONGS TO PEPTIDASE FAMILY C4 SIMILARITY: Belongs to the potyviruses polyprotein family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (BY

-!- FUNCTION: THE ENZYMES WHICH CATALYZE THE REVERSIBLE PHOSPHORYLOSIS
OF PYRAIMIDINE NUCLEOSIDES ARE INVOLVED IN THE DEGRADATION OF THESE
COMPOUNDS AND IN THEIR UTILIZATION AS CARBON AND ENERGY SOURCES,
OR IN THE RESCUE OF PYRIMIDINE BASES FOR NUCLEOTIDE SYNTHESIS.
-!- CATALYTIC ACTIVITY: Thymidline + phosphate = thymine + 2-deoxy-D-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  36 AITENKESDDQ--FLENTLLFKG-FFTGHPWYNDLLVDLGSKDATNKYKGKKVD-----

"Epidermal keratin gene expressed in embryos of Xenopus laevis.";
Proc. Natl. Acad. Sci. U.S.A. 85:5413-5417(1955).
-!- SUBUNIT: Heterotetramer of two type I and two type II keratins.
-!- MISCELLANEOUS: There are two types of cytoskeletal and microfibrillar keratin, I (acidic) and II (neutral to basic) (40-55 and 56-70 kDa, respectively).
-!- SIMILARITY: Belongs to the intermediate filament family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                SEQUENCE FROM N.A.

-!- FUNCTION: ENHANCES THE TRANSATION OF DOWNSTREAM ORF'S ON POLYCISTRONIC MRN4'S DERIVED FROM FIGWORT MOSAIC VIRUS.
-!- SUBCELLULAR LOCATION: Cytoplasmic inclusion bodies.
-!- MISCELLANGORI THE INCLUSION BODIES ARE THE SITE OF VIRAL DNA SYNTHESIS, VIRION ASSENBLY AND ACCUMULATION IN THE INFECTED CE.
-!- SIMILARITY: Belongs to the caulimoviruses viroplasmin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     6.2%; Score 77; DB 1; Length 512; 23.6%; Pred.
